Introduction

This document wants to be a guide for interacting with the BProVe Web Service. BProVe allows to verify correctness properties over BPMN models. For interacting with BProVe, a JSON String has to be formatted and sent to the right address.

JSON String

You can interact with the BProVe Web-Service by sending a JSON String formatted as reported below.

```
{
  "originalModel" : String, //BPMN model in XML format to String
  "parsedModel" : String, //Parsed Model
  "numberOfElement" : int,
  "numberOfPool" : int,
  "numberOfStart" : int,
  "numberOfStartMsg" : int,
  "numberOfEnd" : int,
  "numberOfEndMsg" : int,
  "numberOfTerminate" : int,
  "numberOfTask" : int,
  "numberOfTaskSnd" : int,
  "numberOfTaskRcv" : int,
  "numberOfIntermediateThrowEvent" : int,
  "numberOfIntermediateCatchEvent" : int,
  "numberOfGatewayXorSplit" : int,
  "numberOfGatewayXorJoin" : int,
  "numberOfGatewayAndSplit" : int,
  "numberOfGatewayAndJoin" : int,
  "numberOfGatewayOrSplit" : int,
  "numberOfGatewayEventBased" : int,
  "property" : String, //Property Name
  "poolName" : String, //Pool Name
  "taskName1" : String, //Task Name 1
  "taskName2" : String, //Task Name 2
  "sndMsgName" : String, //Send Message Name
  "rcvMsgName" : String, //Receive Message Name
  "propertyVerificationTime" : String, //Property Verification Time Int to String
  "parsingTime" : String, //Property Verification Time Int to String
  "counterexample" : String, //BPMN highlighted model in XML format to String
  "violatingTrace" : String, //Set of Elements Violating the property String
  "result" : String, //Result of Verification String
}
```

```

ANSWER TO THE FIRST CALL

The result of the first call is a JSON String of the same format but with different values for each field.

```

{

```

NOTE: Details about the type and the number of elements present in the original and parsed model are also returned as a response of the first request (fields from: "numberOfElement" to "numberOfGatewayEventBased"). The time required for parsing, in milliseconds, is also reported.

Step 2.

You want to ask for a property verification over the "parsedModel" resulting from the first request. For doing so, you should proceed sending an Html Post request to BProVe with as content a JSON String formatted as in the first call. However, you also need to set the following fields.

"originalModel" - using the model used for the first call to BProVe,

"parsedModel" - using the value returned by the first call to BProVe,

"property" - using one of the value reported below:

Non-Domain dependent properties - They do not need further fields to be set.

"aBPoolstarts", "aBPoolends", "allBPoolend", "noDeadActivities", "optionToComplete", "properCompletionCF", "properCompletionMF", "properCompletionCFMF", "safeness"

Domain dependent properties - They need further fields to be set:

"aTaskEnabledParameterized", "aTaskRunningParameterized", "aTaskCompleteParameterized" -

For checking these properties you need to specify the name of a Task to the field "taskName1"

"Task1ImpliesTask2" - For checking this properties you need to specify the vale for "taskName1" and "taskName2"

"aBPoolSndMsg" - For checking this property you need to specify the name of a send message to the field "sndMsgName"

"aBPoolRcvMsg" - For checking this property you need to specify the name of a receive message to the field "rcvMsgName"

"aBPoolstartsParameterized", "aBPoolendsParameterized", "noDeadActivitiesParam",

"optionToCompleteParam", "properCompletionCFParam",

"properCompletionMFParam", "properCompletionCFMFParam", "safenessParam" - For checking these properties you need to specify the name of a pool in the field "poolName".

The address at which sending this second Post request is
"http://pros.unicam.it:8080/BProVe_WebService/webapi/BPMNOS/model/verification".
An example of JSON String for the second call is reported in the following.

```
{

This verification may return value for "counterexample" and it corresponds to a BPMN model in XML format, with extensions that allow to visualize element with color. NOTE: This model is properly interpreted by the BPMN Eclipse Modeler (if you open it with other BPMN Editors you may not see the difference from the original model). The verification also returns a value for the field "result" which is False if the property verification returns false, vice versa it is true. A value byte[] is also assigned to the field "violatingTrace" and, if converted to String, it refers to some of the elements that violate the property.
